My comment applies to many sectors. When analyzing portfolios in order to find the ESG risks and opportunities most frequent ESG issue which pops up is Lifecycle impacts of products and services which is very difficult to explain to clients. They need to know what is for example % of manufacturing renewable energy, categories of energy efficient products, energy storage and distribution. Where can one find these. So 2 wishes 1) simplify and open the concept of Lifecycle impacts of products and services
2) to be able to find the role as % of the above mentioned issues (% of energy efficiency products) that is what the clients want to know
