In principle I support the proposed changes to the Metals & Mining Standards towards an expanded approach on disclosure associated with tailings storage facilities management. An inventory table format is appropriate provided it is broken down to individual TSFs. My primary item of feedback is that recording tailings in metric tonnes (t) may be less meaningful than in cubic metres (m<sup>3</sup>), as the risks associated with tailings relate less to their weight, than their volume.

I believe that disclosure on all hazardous waste incidents is useful and would prompt more complete disclosure on the nature of the material hazardous waste incidents.
